Participatory, normative scenarios

Nature for Nature emphasizes the **protection and promotion** of biodiversity. This scenario characterizes that in certain areas for biodiversity promotion, humans are denied access. There is a societal consensus that biodiversity needs its space to thrive, as **people value nature for its intrinsic values**. This scenario assumes that human society globally follows sustainable pathways (SSP1) and **climate action is effective (RCP2.1)**. Switzerland aims for an economy beyond growth and expands **protected areas to 30%** of the Swiss land area until 2060.

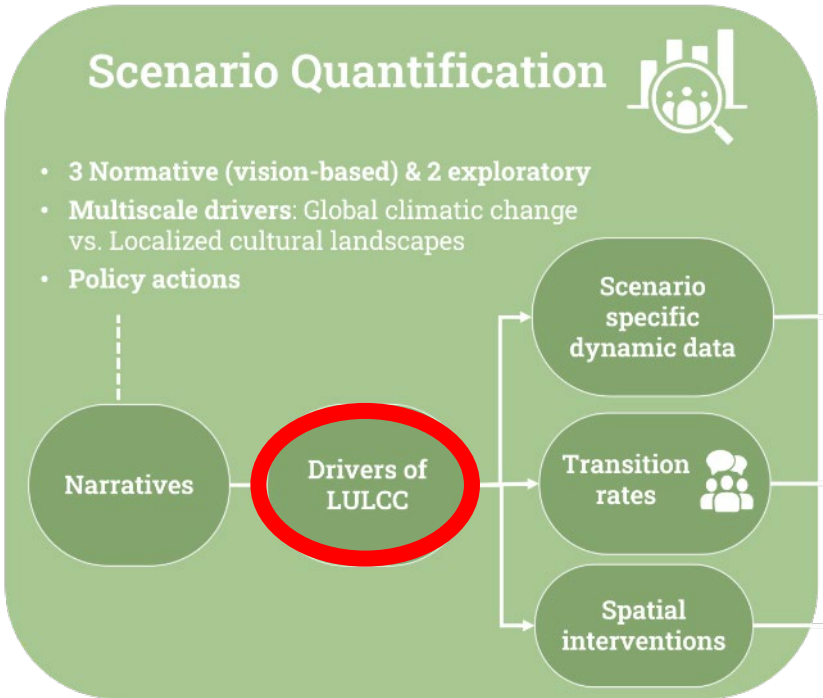

Participatory, normative scenarios

Nature for Society focuses on the **sustainable supply of NCPs** to the Swiss population. It assumes a strong division of the landscape: Housing, agricultural production, biodiversity protection, recreation, energy production are spatially separated. This has implications for the planning of rural and urban areas, with most people living in large, green cities. A global development of **RCP4.5** and SSP2 and a Swiss economy characterized **by green growth** form underlying assumptions of this scenario.

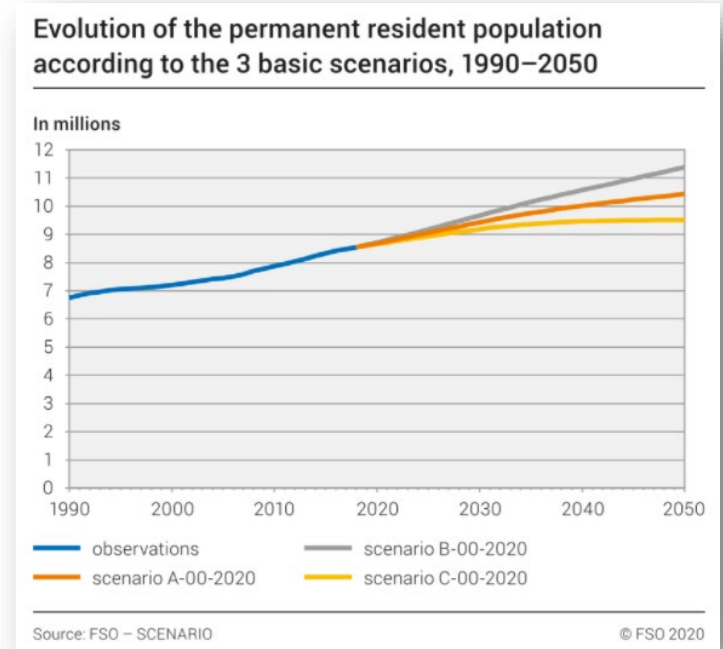

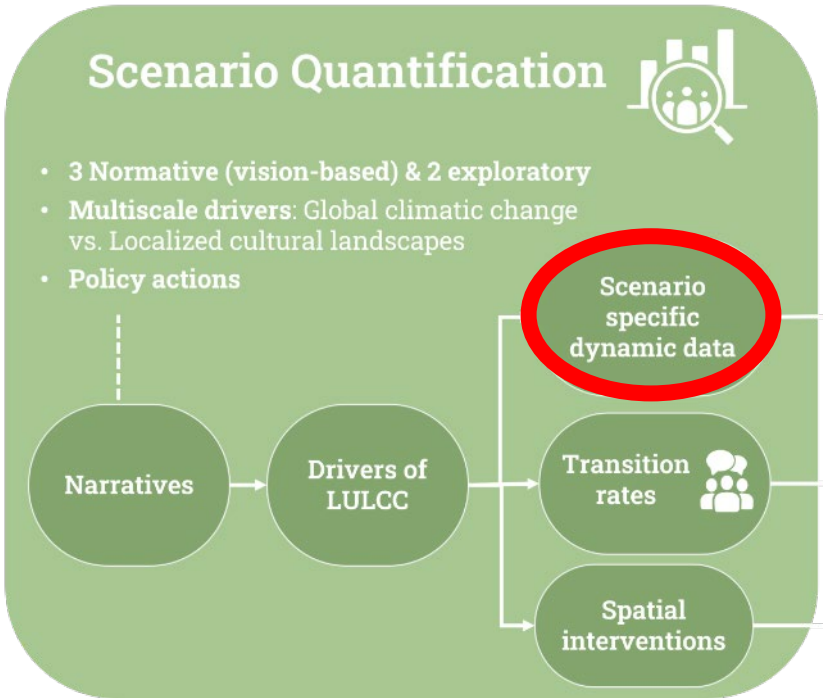

Participatory, normative scenarios

Driver	Nature for Nature	Nature for Society	Nature as Culture	Business as Usual	Growth and Extinction
Climate	+1.4°C RCP 2.6	+2.3°C RCP 4.5	+1.4°C RCP 2.6	+2.3°C RCP 4.5	+3.1°C RCP 8.5
Population	Low 9.5M	Reference 10.5M	Reference 10.5M	Reference 10.5M	High 11.5M
Land Use	22% (2030) 30% (2060)	17% (2030) 22% (2060)	17% (2030) 25% (2060)	15% (2030) 20% (2060)	15% (2030) 0% (2060)
Economic	SSP 1 Green Road	SSP 2 Middle of the road	SSP 1 Green Road	SSP 2 Middle of the road	SSP 3 Rocky Road

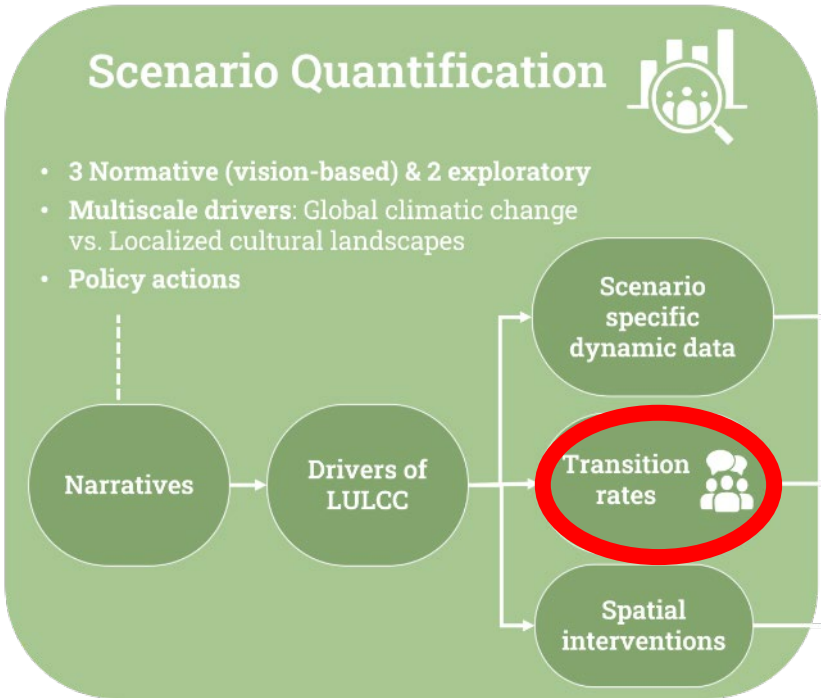

Participatory, normative scenarios

Driver	Sub-Driver	Urban
		Influence (+,+,0,-,-)
Spatial management of landscape	Multifunctional land management (biodiversity promotion integrated in agriculture). Moderate settlement growth	+
	Moderate growth of urban and peri-urban areas Rural exodus from mountain communes to cities Level of urban sprawl as today.	
	Soil-independent production only to a minor extent Intensive soil-dependent agriculture in rural areas Abandonment of poorly accessible marginal land	
	PAs are expanded and newly established (15% of Swiss land area protected by 2030, 17% by 2060) Site selection for new PAs prioritized on agriculturally unproductive land, or to protect habitats of endangered species; site-specific management under IUCN categories II or IV	

From	To				
	Urban	Static	Open forest	Closed forest	Shrubland
Urban	99,34%	0,66%	0,00%	0,00%	0,00%
Static	0,00%	100,00%	0,00%	0,00%	0,00%
Open forest	0,00%	0,00%	0,00%	120,43%	0,00%
Closed forest	0,00%	0,00%	12,32%	87,68%	0,00%
Shrubland	0,00%	0,00%	21,54%	7,96%	66,35%

Participatory, normative scenarios

Scenario narrative: “Protected area coverage increased to 30% prioritizing areas for...”

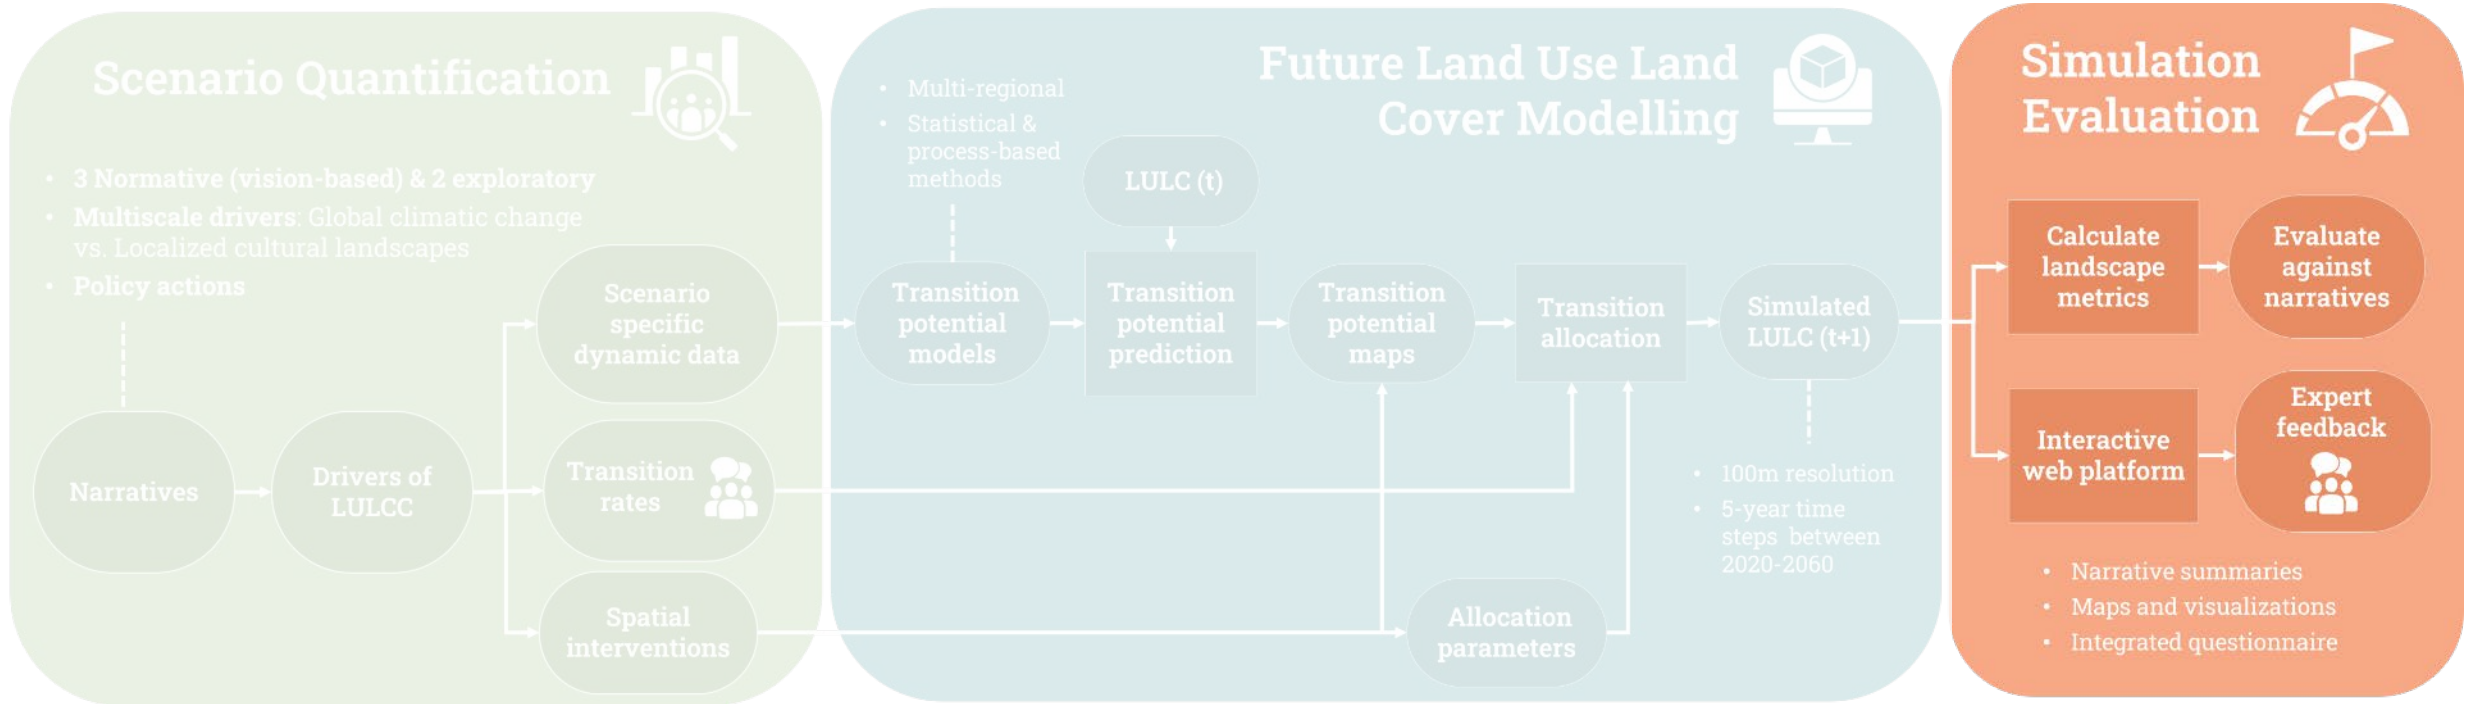

Mechanism: Introduce new hypothetical PAs over simulation time steps, reduce the conversion of natural and semi-natural land to artificial LULC

- Existing protected areas
- Prioritizing biodiversity
- Prioritizing cultural heritage
- Prioritizing Ecosystem services

Conclusions

Which areas shall we protect for biodiversity?

- 1) Consider temporal and spatial dynamics of biodiversity and NCPs
- 2) Define clear and negotiable goals
- 3) Communicate social value of biodiversity

Defining priority areas for biodiversity requires societal value negotiations.

Scenarios and simulations are useful 'boundary objects' in this process.
