# Ecological Infrastructure

- Switzerland has a target to ensure a functioning national Ecological Infrastructure by 2040
- Achieving this target has its challenges:
  - 'Functioning' must take into account future change processes (climatic change).
  - It will necessitate decisions about which areas to include and how to manage them which must be negotiated by society.

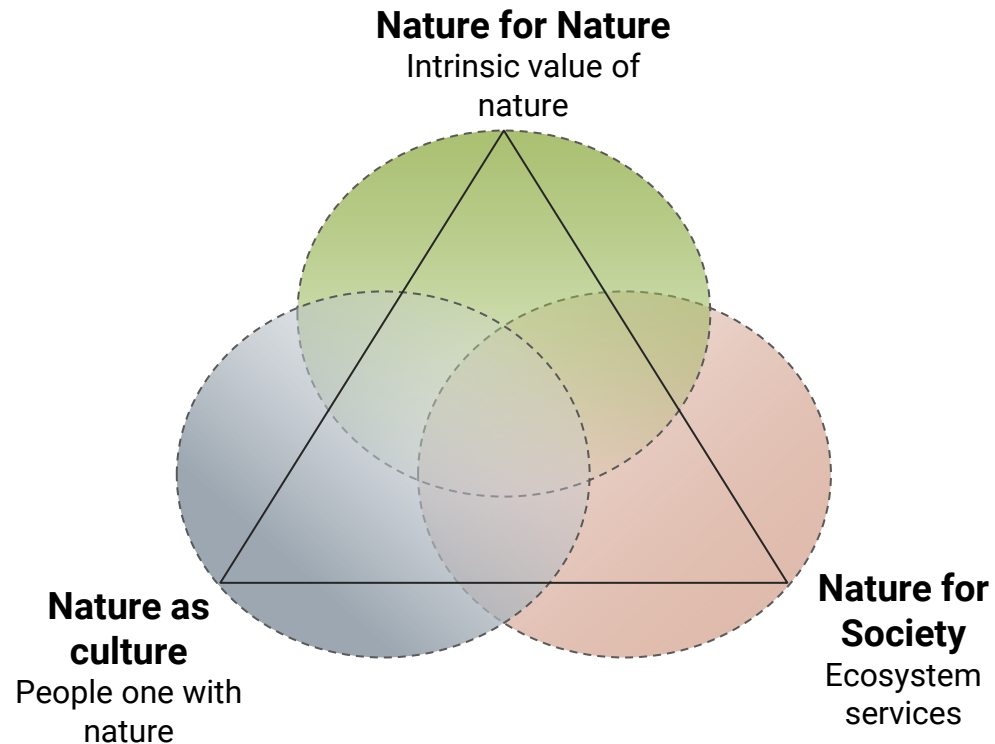

# Methods to support EI decision making

# Scenarios

## Societal-nature value perspectives

## Future trends in drivers of system change

	+1.4°C RCP 2.6	+2.3°C RCP 4.5	+1.4°C RCP 2.6	+2.3°C RCP 4.5	+3.1°C RCP 8.5
	Low 9.5M	Reference 10.5M	Reference 10.5M	Reference 10.5M	High 11.5M
	22% (2030) 30% (2060)	17% (2030) 22% (2060)	17% (2030) 25% (2060)	15% (2030) 20% (2060)	15% (2030) 0% (2060)
	SSP 1 Green Road	SSP 2 Middle of the road	SSP 1 Green Road	SSP 2 Middle of the road	SSP 3 Rocky Road

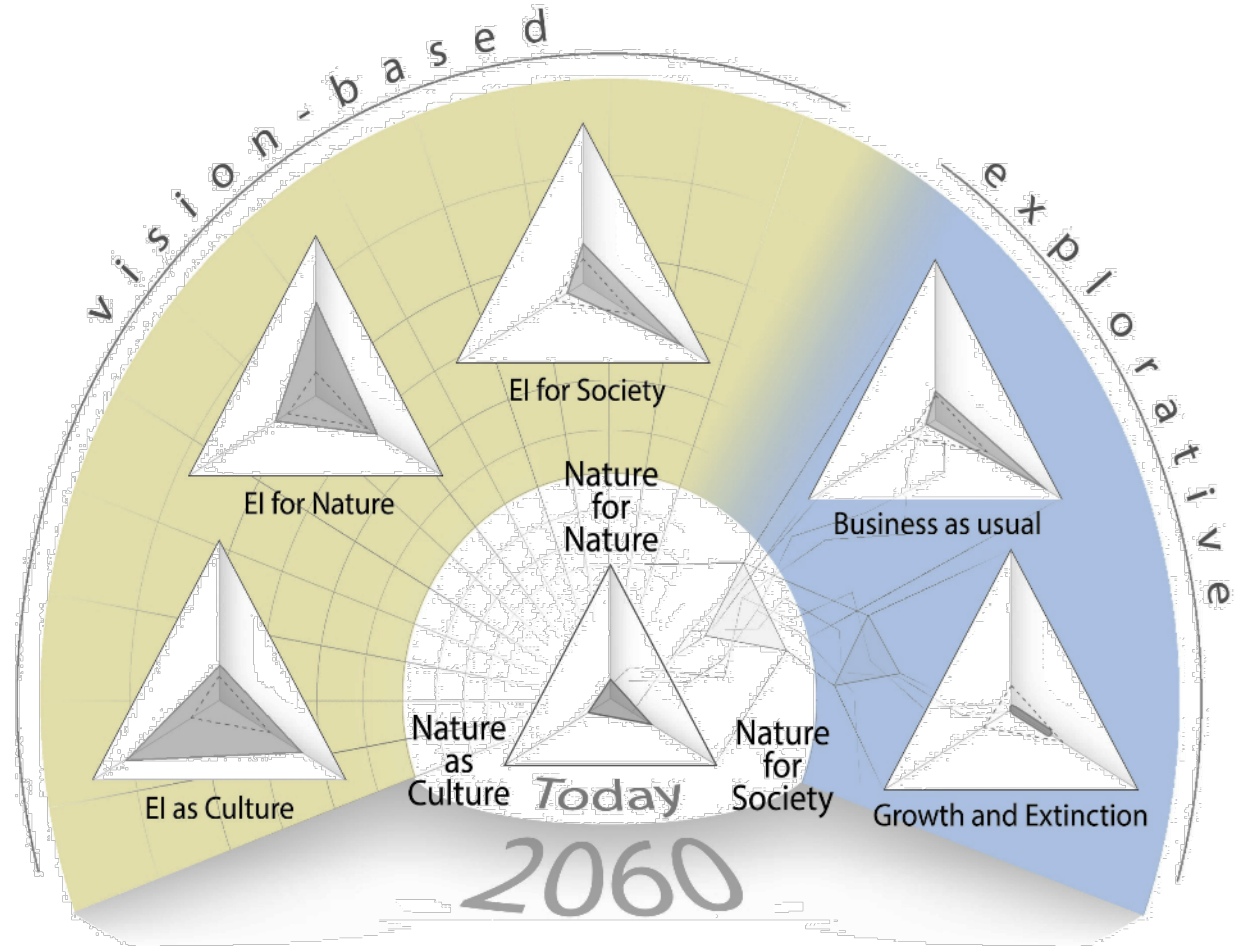

# Scenarios

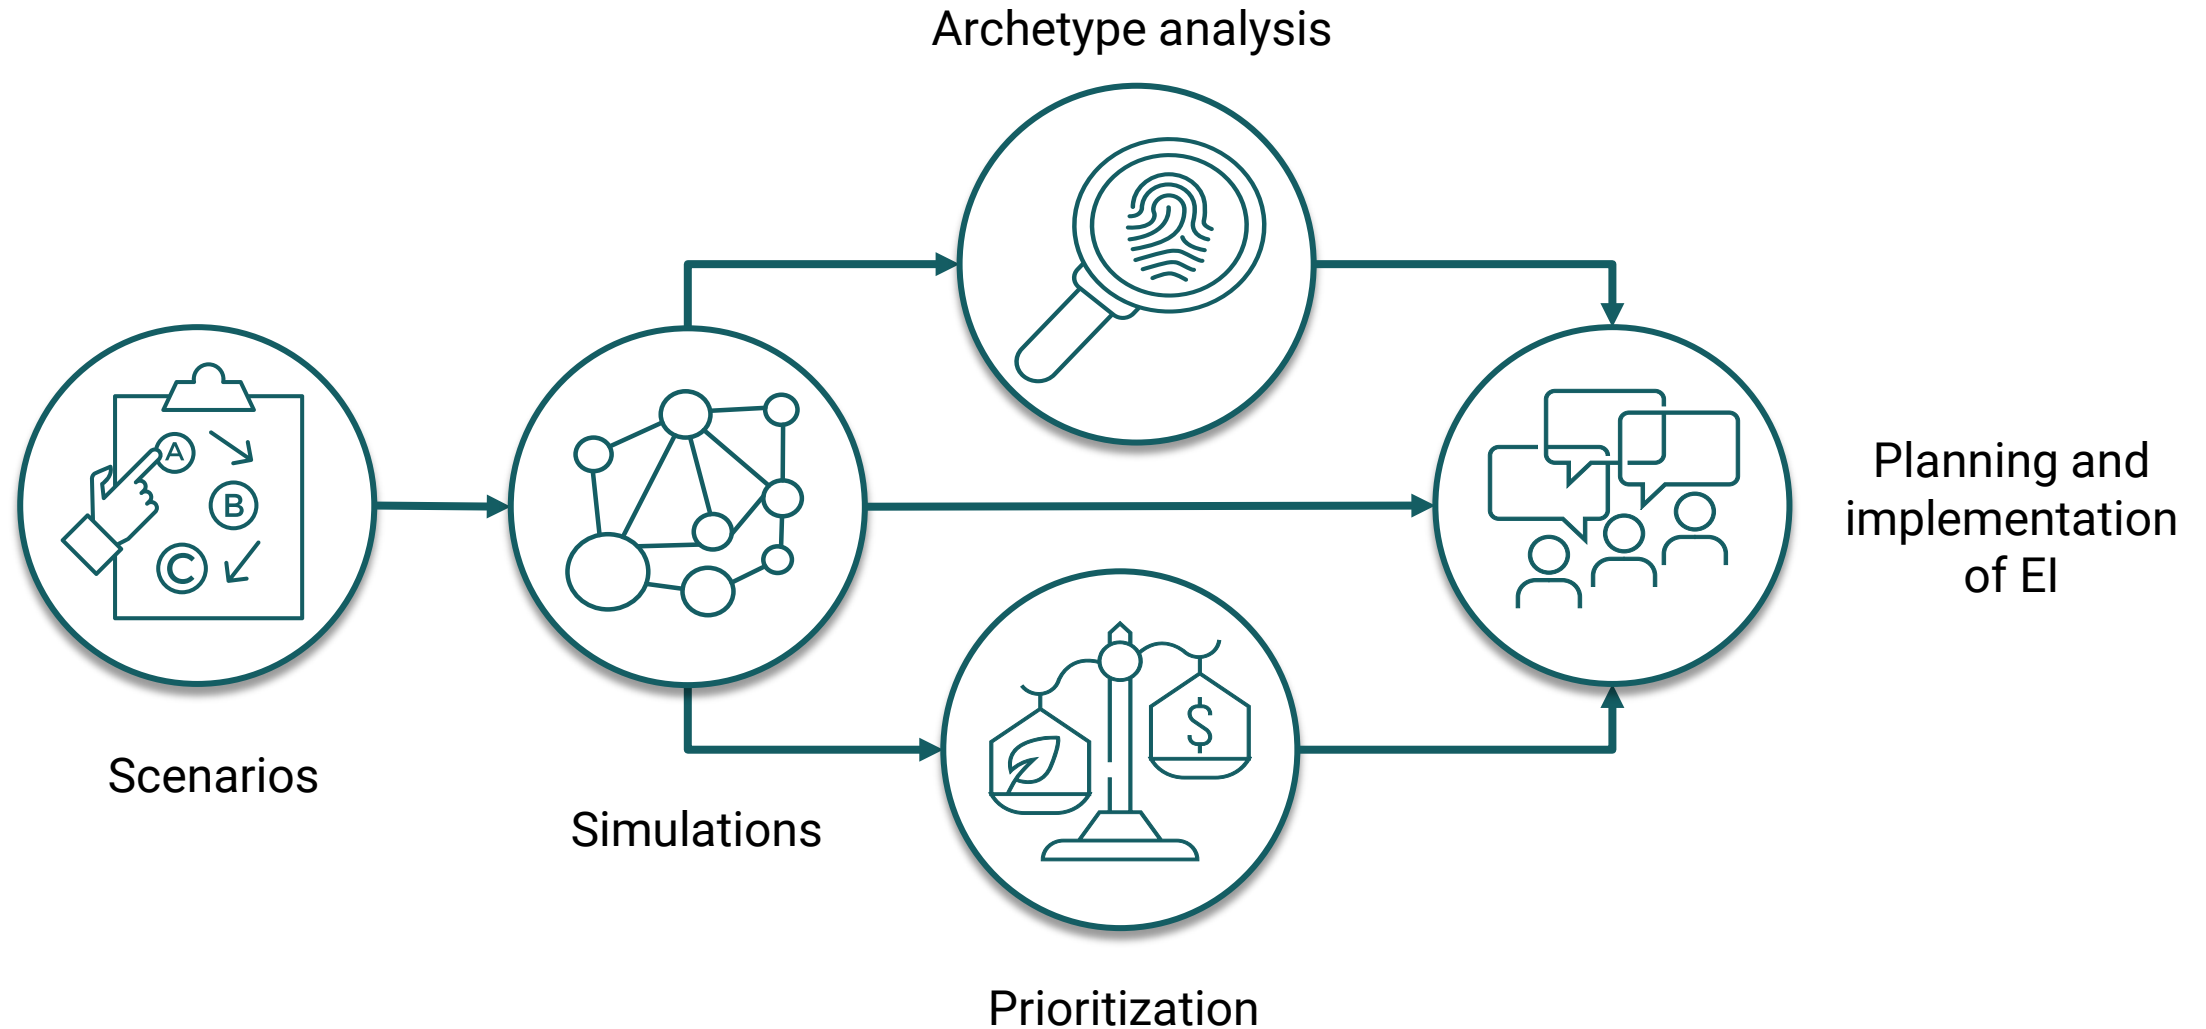

ValPar.CH

## Five scenarios framing the development of EI in Switzerland between 2020-2060

# Methods to support EI decision making

# Simulations

Land Use Land Cover Change  
modelling

Ecosystem service  
modelling

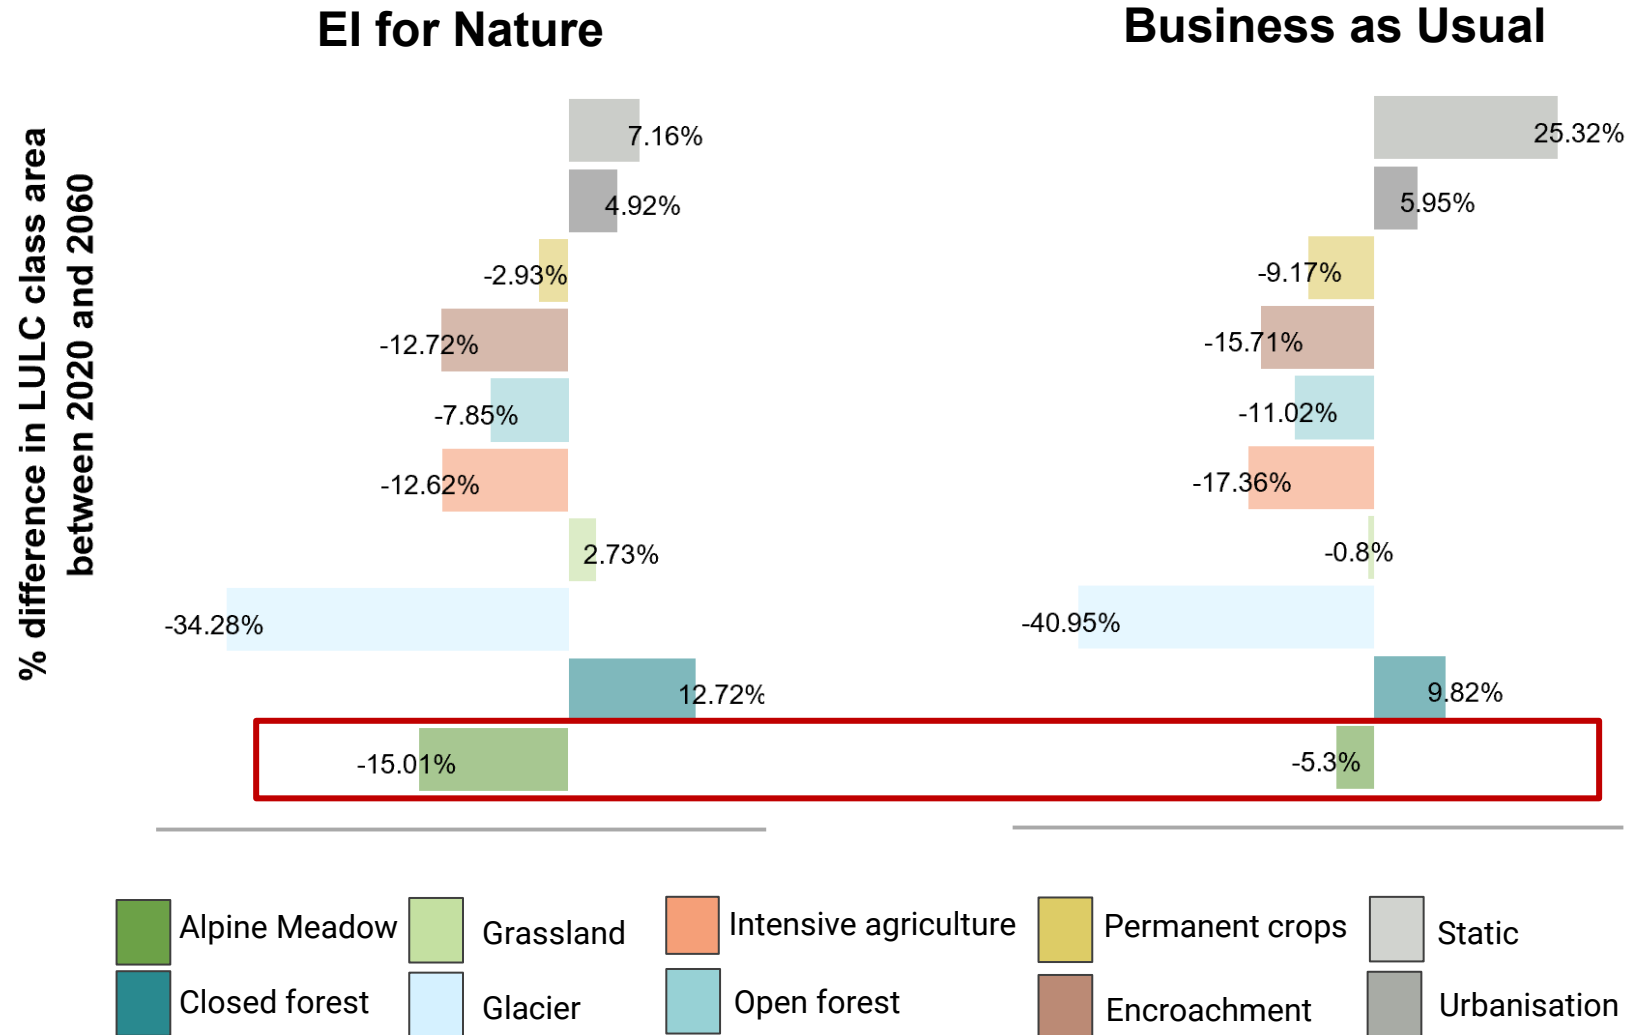

Species distribution  
modelling

# Simulations

## Simulations

**Habitat suitability in proposed EI sites in 2020**

**but in 2060 under climate change (+2.5C)**

Habitat suitability

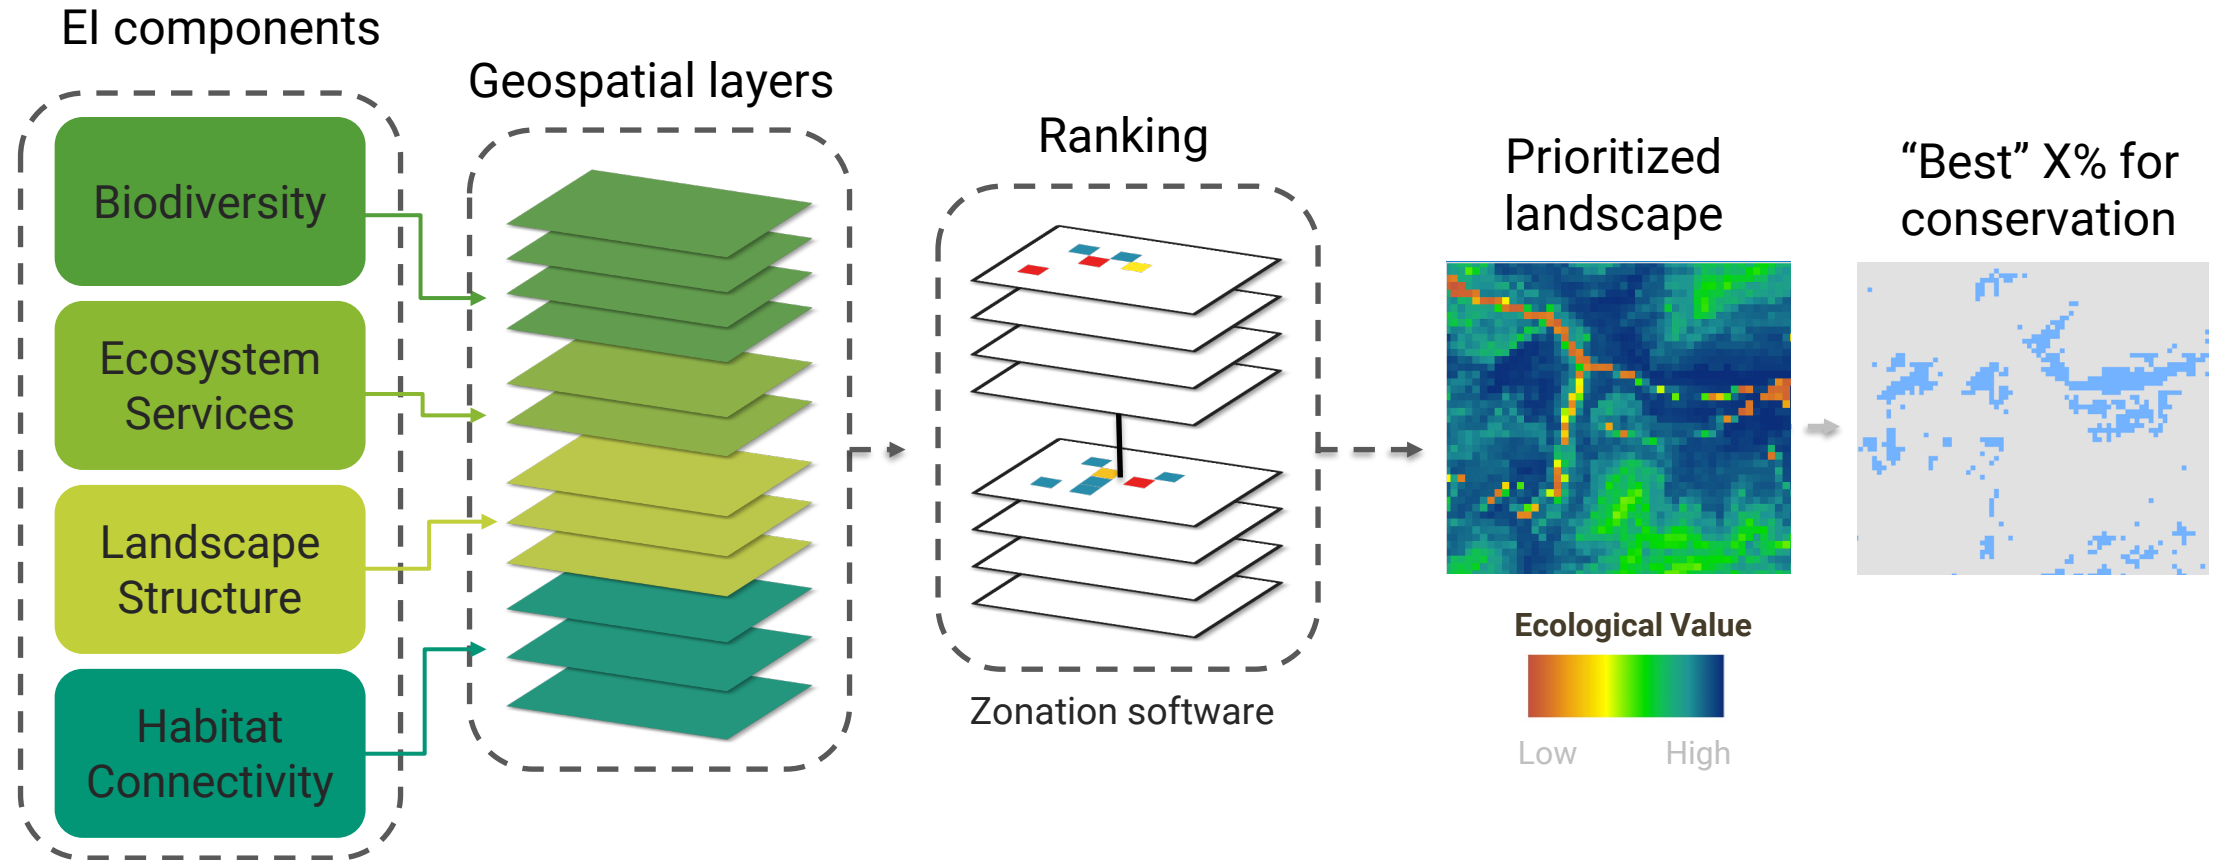

# Methods to support EI decision making

# Prioritization

Ranking of areas in the landscape based on their importance for Nature conservation

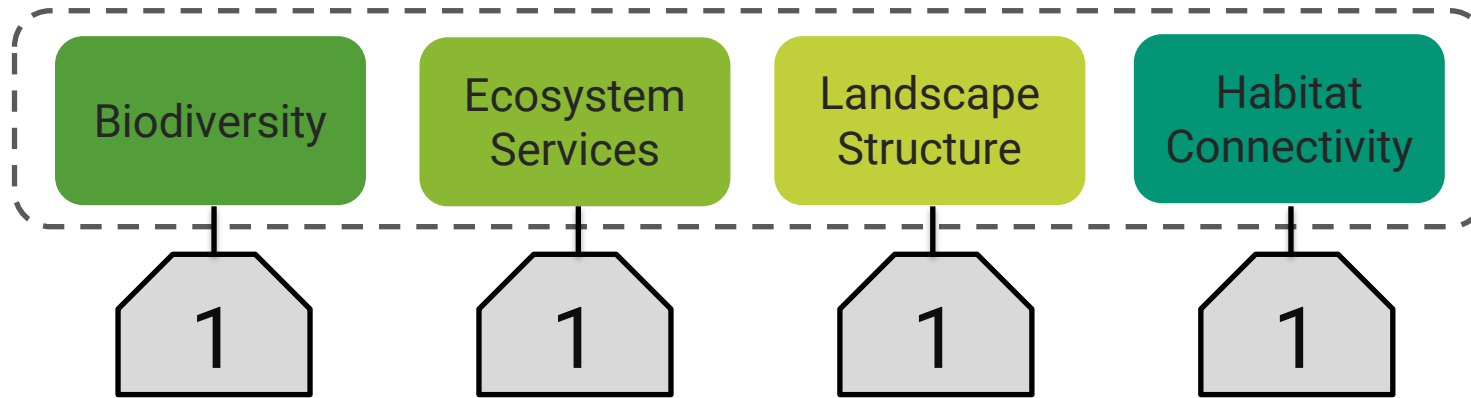

# Prioritization

## Weighting possibilities

EI components

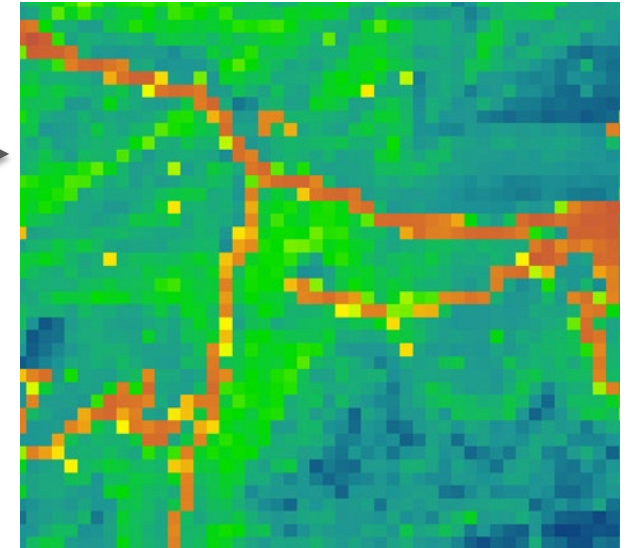

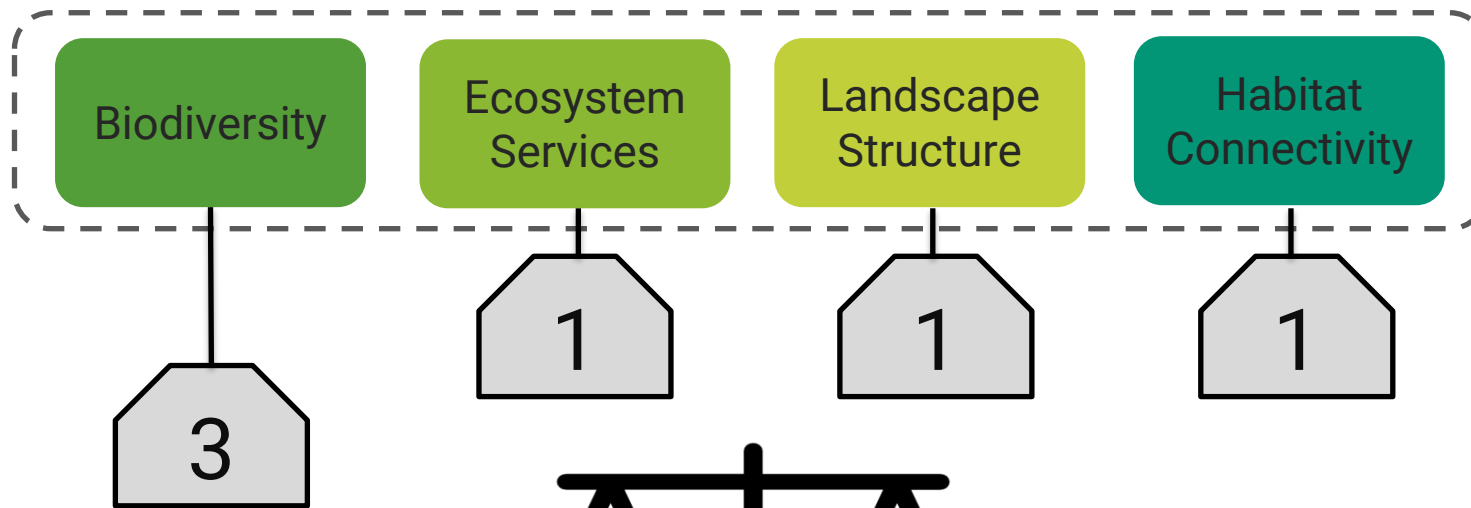

Ecological Value  
Low High

# Prioritization

## Weighting possibilities

EI components

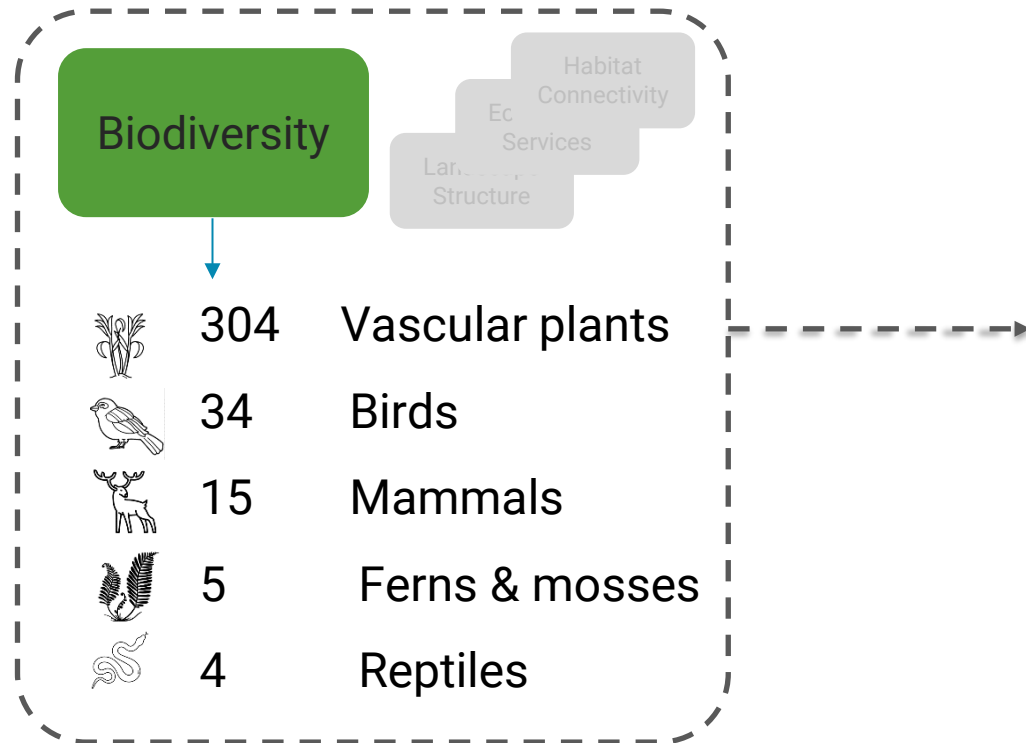

# Prioritization

Example with 362 species

EI components

**2020**

**2060**

BAU scenario

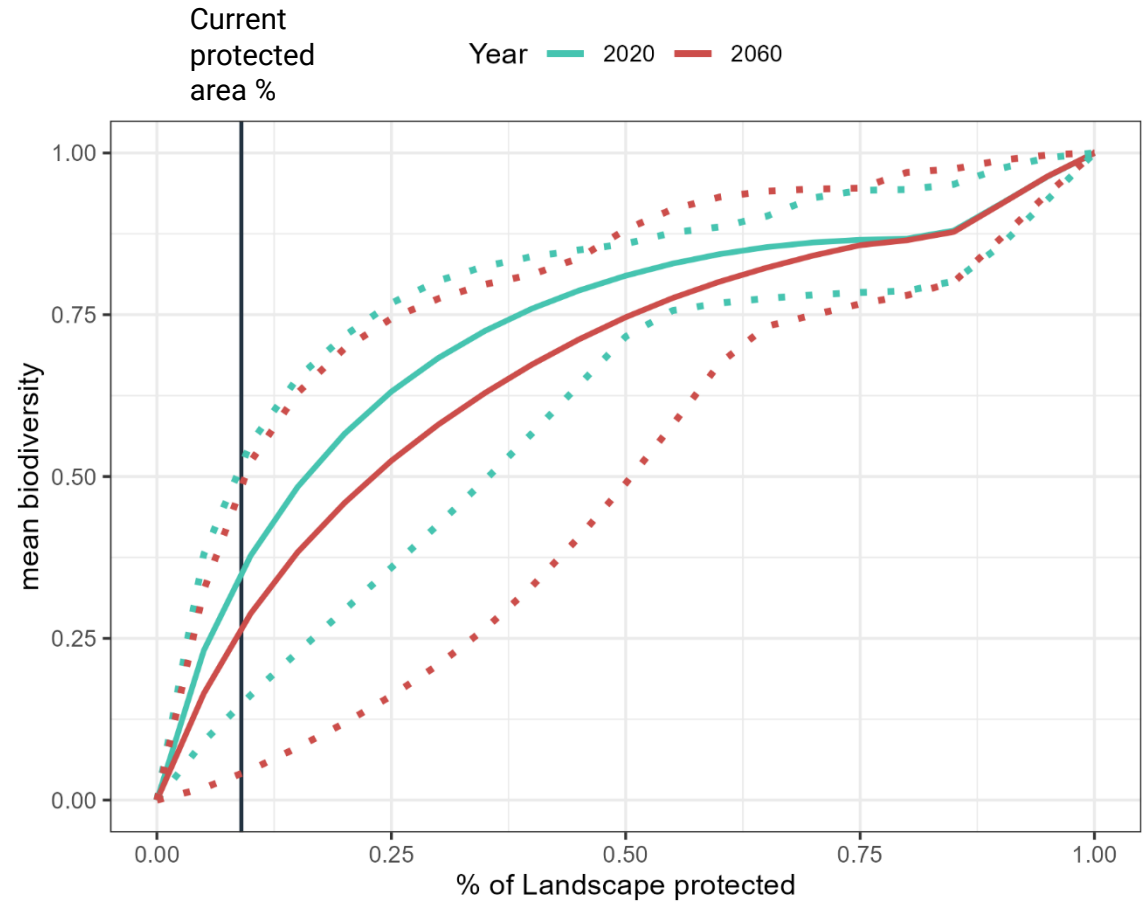

## Prioritization

### Example with 362 species

BAU scenario

→ The best areas of the EI identified today may be less suited to the species in the future

# Methods to support EI decision making

# Archetypes

## Definition

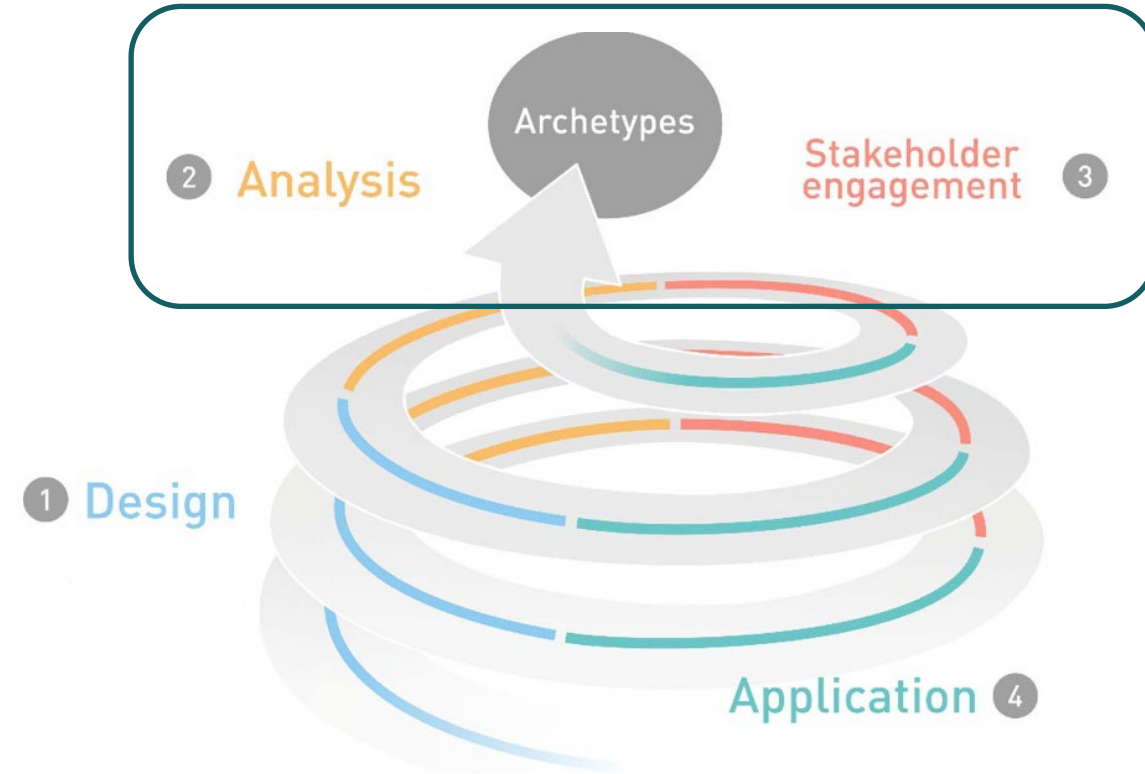

- Archetypes are recurring patterns in landscapes that can represent distinct landscape units or new combinations of landscape attributes designed for specific purposes.

## Analysis

- Clustering and machine learning to detect and group these recurring patterns.

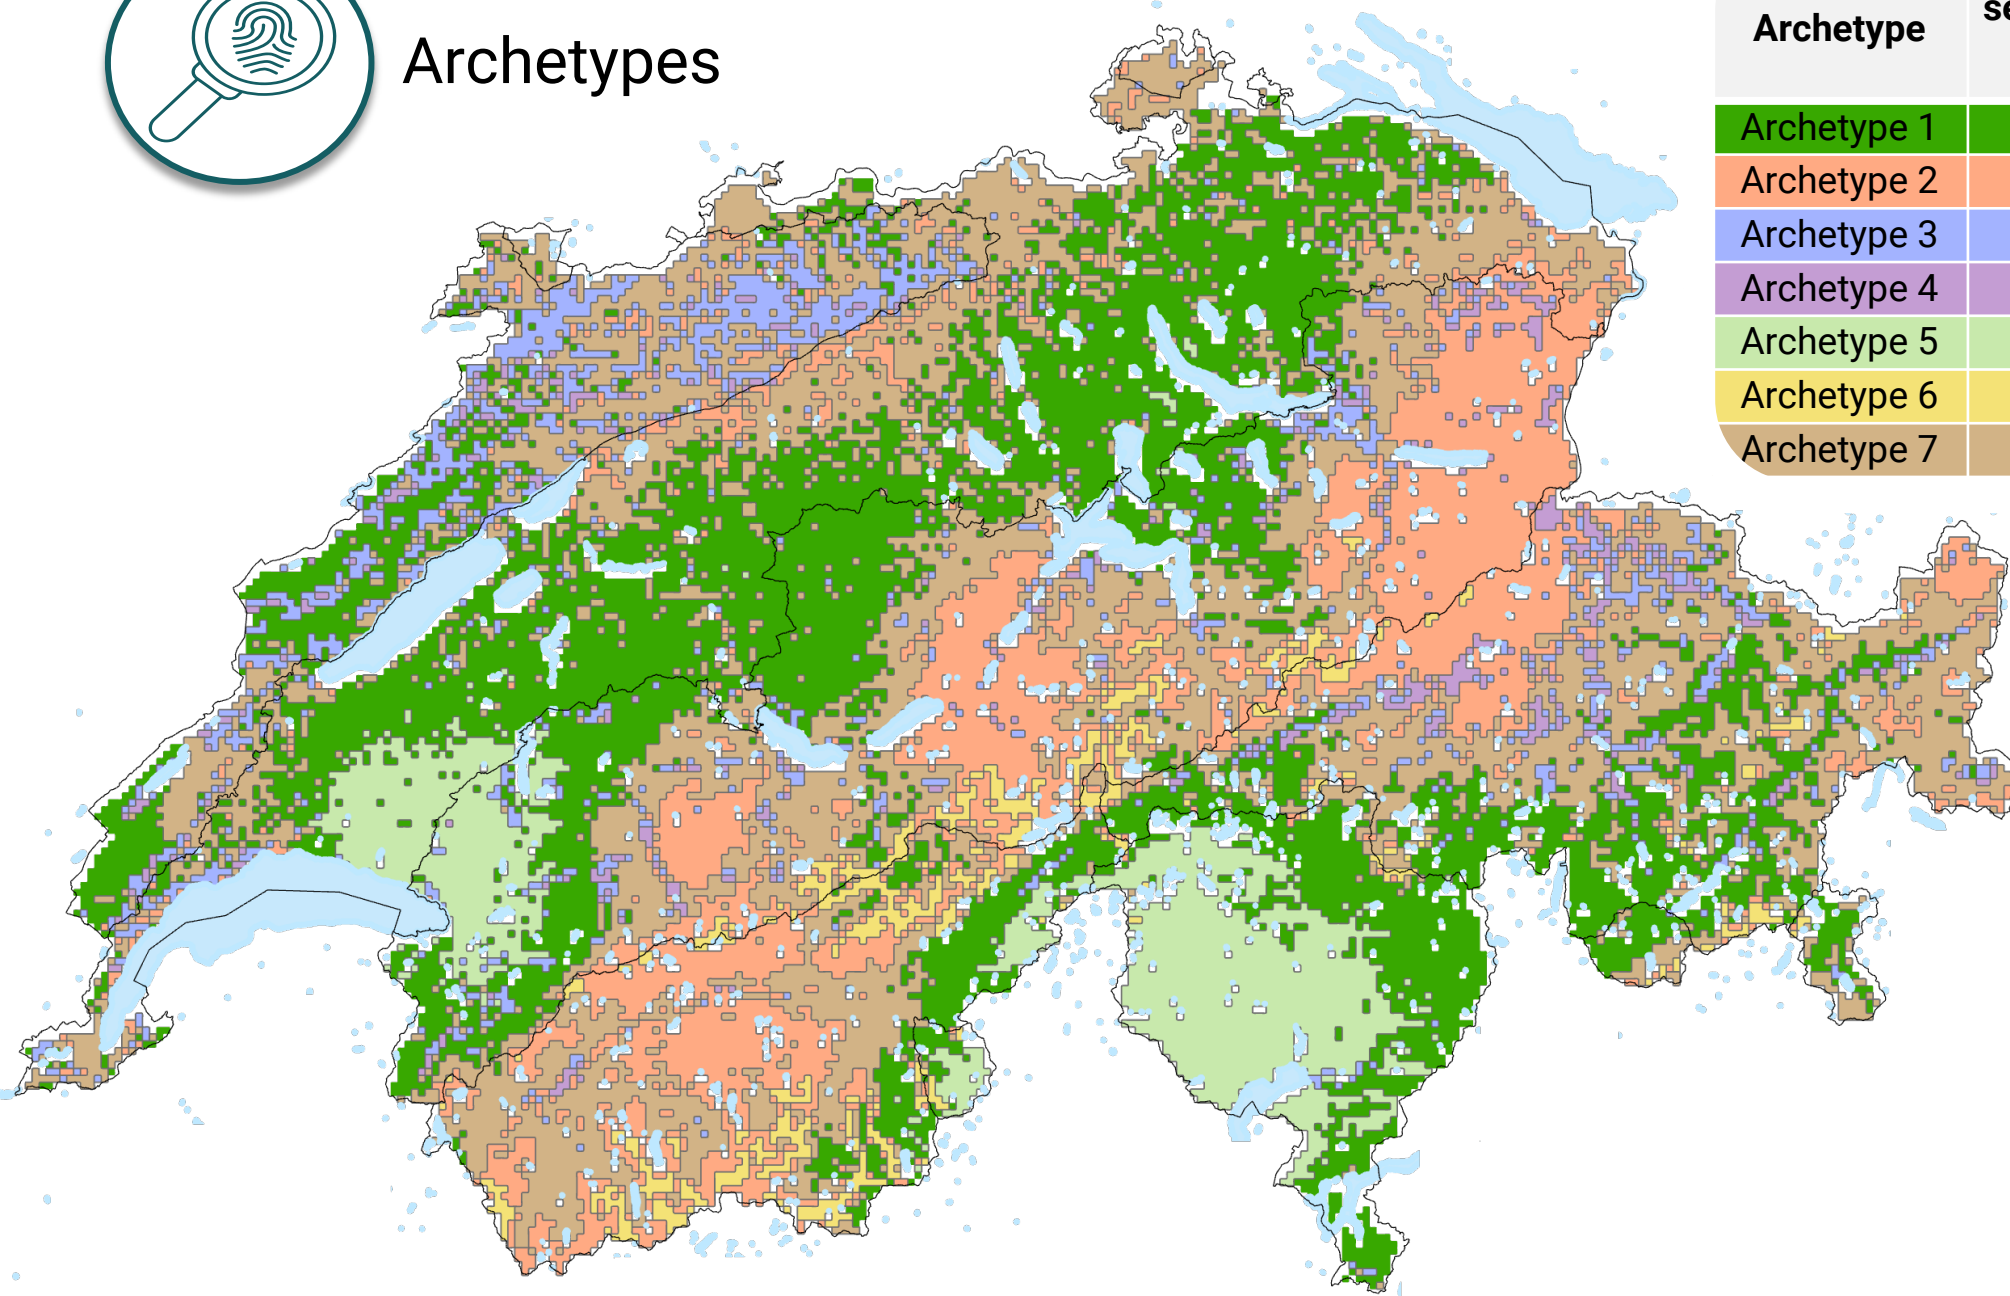

## Stakeholder Engagement

- Semi-structured interviews to engage with key stakeholders to provide recommendations for management and policies.

# Archetypes

Archetype	Ecosystem service change until 2060	Biodiversity change until 2060
Archetype 1	●▲▲▲	●▲▲▲
Archetype 2	●▲	●▲▲▲
Archetype 3	●▼▼▼	●▼▼
Archetype 4	●▼▼▼	●▼▼
Archetype 5	●▼	●▲▲▲
Archetype 6	●▼▼▼	●▲▲
Archetype 7	●▲	●▲▲

- ▲▲▲: High (top third)
- ▲▲: Medium (middle third)
- ▲: Low (bottom third)
- ▼: Low (top third)
- ▼▼: Medium (middle third)
- ▼▼▼: High (bottom third)

# Archetypes

## Stakeholder Engagement

- Using the archetypes we asked stakeholders to provide their expertise.
- Addressing challenges:

*“In (...) we have one major problem or management issue, that we have to conciliate biodiversity conservation with leisure activities in the forest.”*

- Addressing pathways to tackle these challenges:

*“We also need multi disciplinary work groups, so that policymakers also have biologists or other scientists around the table to talk and exchange on these two metrics [ecosystem services and biodiversity]”*

# Methods to support EI decision making

# Conclusion

- Models and simulations are **not exact representations of reality**
- Rather they should be considered 'boundary objects' we can use to discuss aspects of decisions with stakeholders

Including diverse perspectives

Robustness of plans to future change

Effects of setting different priorities

Identifying similarities for management

Thank you for  
listening

I will now take any  
questions.
